

CLAIMS

1. A negative-resistance circuit comprising:
 - a transistor;
 - a plurality of distributed constant lines respectively connected to three terminals of said transistors; and
- 5 an inductance element connected between an output terminal of said negative-resistance circuit and a ground potential for adjusting a negative resistance value.
2. The negative-resistance circuit according to claim 1, wherein:
 - 5 said inductance element comprises a distributed constant line shorter than one-quarter wavelength at a desired frequency for connecting between a signal conductor and the ground potential.
3. The negative-resistance circuit according to claim 1, wherein:
 - 10 said distributed constant line is a coplanar type one composed of a signal conductor and ground conductors disposed to sandwich said signal conductor with predetermined gaps therebetween, and
 - 10 said inductance element comprises a conductor piece which traverses only one of said gaps to connect said signal conductor with said ground conductor.
4. A negative-resistance circuit comprising:
 - a transistor;
 - a plurality of distributed constant lines respectively connected to three terminals of said transistors; and

5

a capacitance element connected between an output terminal of said negative-resistance circuit and a ground potential for adjusting a negative resistance value.

5. The negative-resistance circuit according to claim 4, wherein:

 said capacitance element comprises a distributed constant line which is branched from a signal conductor, has an opened leading end, and is shorter than one-quarter wavelength at a desired frequency.

5

6. The negative-resistance circuit according to claim 4, wherein:

 said distributed constant line is a coplanar type one composed of a signal conductor and ground conductors disposed to sandwich said signal conductor with predetermined gaps therebetween, and

5

 said capacitance element comprises a conductor piece which is branched from said signal conductor and has an opened leading end.

7. The negative-resistance circuit according to claim 1, wherein a plurality of distributed constant lines are connected in parallel to at least one of the three terminals of said transistor.

8. The negative-resistance circuit according to claim 4, wherein a plurality of distributed constant lines are connected in parallel to at least one of the three terminals of said transistor.

9. A negative-resistance circuit comprising:
 a transistor;

a plurality of distributed constant lines respectively connected to three terminals of said transistor; and

5 a plurality of distributed constant lines connected in parallel to at least one of the three terminals of said transistor.

10. The negative-resistance circuit according to claim 7, wherein: one of said plurality of distributed constant lines connected in parallel is a distributed constant line which is longer than one-quarter wavelength and shorter than one-half wavelength at a desired frequency,

5 and has a leading end connected to a ground potential.

11. The negative-resistance circuit according to claim 7, wherein: one of said plurality of distributed constant lines connected in parallel is a distributed constant line which is shorter than one-quarter wavelength at a desired frequency, and has an opened leading end, and

5 the remaining distributed constant lines are distributed constant lines each having a leading end short-circuited to a ground potential.

12. The negative-resistance circuit according to claim 8, wherein: one of said plurality of distributed constant lines connected in parallel is a distributed constant line which is longer than one-quarter wavelength and shorter than one-half wavelength at a desired frequency,

5 and has a leading end connected to a ground potential.

13. The negative-resistance circuit according to claim 8, wherein: one of said plurality of distributed constant lines connected in

parallel is a distributed constant line which is shorter than one-quarter wavelength at a desired frequency, and has an opened leading end, and the remaining distributed constant lines are distributed constant lines each having a leading end short-circuited to a ground potential.

14. The negative-resistance circuit according to claim 9, wherein:
one of said plurality of distributed constant lines connected in
parallel is a distributed constant line which is longer than one-quarter
wavelength and shorter than one-half wavelength at a desired frequency,
and has a leading end connected to a ground potential.

5

15. The negative-resistance circuit according to claim 9, wherein:
one of said plurality of distributed constant lines connected in
parallel is a distributed constant line which is shorter than one-quarter
wavelength at a desired frequency, and has an opened leading end, and
the remaining distributed constant lines are distributed
constant lines each having a leading end short-circuited to a ground potential.

5

16. The negative-resistance circuit according to claim 7, wherein:
said transistor is a field effect transistor, and
said terminal to which said plurality of distributed constant lines
are connected in parallel is a source of said field effect transistor.

5

17. The negative-resistance circuit according to claim 8, wherein:
said transistor is a field effect transistor, and
said terminal to which said plurality of distributed constant lines

are connected in parallel is a source of said field effect transistor.

5

18. The negative-resistance circuit according to claim 9, wherein:
said transistor is a field effect transistor, and
said terminal to which said plurality of distributed constant lines
are connected in parallel is a source of said field effect transistor.

5

19. The negative-resistance circuit according to claim 16, wherein:
an output terminal of said negative-resistance circuit is
disposed through a distributed constant line connected to a gate of said field
effect transistor, wherein:
said negative-resistance circuit comprises:
a bias power source for supplying said gate with a
predetermined DC voltage; and
a resistor connected between said bias power source and said
distributed constant line connected to said gate.

10

20. The negative-resistance circuit according to claim 17, wherein:
an output terminal of said negative-resistance circuit is
disposed through a distributed constant line connected to a gate of said field
effect transistor, wherein:
said negative-resistance circuit comprises:
a bias power source for supplying said gate with a
predetermined DC voltage; and
a resistor connected between said bias power source and said
distributed constant line connected to said gate.

21. The negative-resistance circuit according to claim 18, wherein:
an output terminal of said negative-resistance circuit is
disposed through a distributed constant line connected to a gate of said field
effect transistor, wherein:
said negative-resistance circuit comprises:
a bias power source for supplying said gate with a
predetermined DC voltage; and
a resistor connected between said bias power source and said
distributed constant line connected to said gate.

10

22. An active filter comprising:
the negative-resistance circuit according to claim 1; and
a resonator connected in series with said negative-resistance
circuit.

5

23. An active filter comprising:

- the negative-resistance circuit according to claim 4; and
- a resonator connected in series with said negative-resistance circuit.

5

24. An active filter comprising:

- the negative-resistance circuit according to claim 9; and
- a resonator connected in series with said negative-resistance circuit.
